DECISION STATEMENT
(by EPA RPM)

Date recd: TRA-60 OU 2-14

Disposition:

A track I investigation with sampling supporting the presence of elevated lead & mercury levels in soil as a result of releases associated with a regenerant neutralization tank system. It is reported that the RCRA/HWMA tank system closure was performed under the VCO in the year 2000. However, it is also reported that characterization sampling in support of the VCO was done in 2001? The package does not include any correspondence from IDEQ on the RCRA/HWMA closure. For example, how was clean closure established if hazardous constituents remain? This information is needed prior to determining if a Track II process is warranted to avoid duplication of effort. Also, if a Track II is performed what will be its focus? Identifying the PSQ in a revised Track I package would be helpful.
